VIBURNUM AMERICANUM (American Highbush Cranberry)

This is what the University of Wisconsin says about it. "The American Highbush Cranberry (*Viburnum Americanum*) is bound to come into greater prominence than it is at the present time. As an ornamental shrub, it stands at the top of the ladder. In the spring it is covered with showy white cymes of flowers; then in the fall and long into the winter the shrub makes itself known by its scarlet, translucent fruit. Besides being beautiful, the fruit of the American Highbush Cranberry has another property that is not as well known as it should be. That is, it is eatable. It makes very good jelly alone or with other less tart fruits such as apples or peaches. It is very cosmopolitan, growing in all types of soils and will do well in either sun, part sun or shade. When ordering Highbush cranberry be sure you get *Viburnum Americanum* instead of *Viburnum opulus* which is the European variety. The fruit of the latter is not eatable, having a bitter quinine taste.

		100	1000
1 yr. seedlings	2-4 inches	\$3.50	\$30.00
	4-6 inches	4.50	40.00
